

*TOEFL® Research* INSIGHT

# *TOEFL®* Research

VOLUME 2

# TOEFL® Research Insight Series, Volume 2: TOEFL Research

## Preface

The *TOEFL iBT*® test is the world's most widely respected English language assessment and is used for admissions purposes in more than 130 countries, including Australia, Canada, New Zealand, the United Kingdom, and the United States. Since its initial launch in 1964, the *TOEFL*® test has undergone several major revisions motivated by advances in theories of language ability and changes in English teaching practices. The most recent revision, the *TOEFL iBT* test, was launched in 2005. It contains a number of innovative design features, including integrated tasks that engage multiple skills to simulate language use in academic settings, and test materials that reflect the reading, listening, speaking, and writing demands of real-world academic environments.

In addition to the *TOEFL iBT* test, the *TOEFL Family of Assessments* has been expanded to provide high-quality English proficiency assessments for a variety of academic uses and contexts. The *TOEFL Young Students Series (YSS)* features the *TOEFL Primary*® and *TOEFL Junior*® tests, which are designed to help teachers and learners of English in school settings. The *TOEFL ITP*® program offers colleges, universities, and others affordable tests for placement and progress monitoring within English programs.

At ETS, we understand that scores from the *TOEFL Family of Assessments* are used to help make important decisions about students, and we would like to keep score users and test takers up-to-date about the research results that assure the quality of these scores. Through the publication of the *TOEFL Research Insight Series*, we wish to communicate to institutions and English teachers who use any/all of the *TOEFL* tests about the strong research and development base that underlies the *TOEFL Family of Assessments* and to demonstrate our continued commitment to research.

Since the 1970's, the *TOEFL* test has had a rigorous, productive, and far-ranging research program. But why should test score users care about the research base for a test? In short, it is only through a rigorous program of research that a testing company can substantiate claims about what test takers know or can do based on their test scores, as well as provide support for the intended uses of assessments. Beyond demonstrating this critical evidence of test quality, research is also important for enabling innovations in test design and ensuring that the needs of test takers and test score users are persistently met. This is why ETS has made the establishment of a strong research base a fundamental feature underlying the evolution of the *TOEFL Family of Assessments*.

The *TOEFL Family of Assessments* is designed, produced, and supported by a world-class team of test developers, educational measurement specialists, statisticians, and researchers in applied linguistics and language testing. Our test developers have advanced degrees in fields such as English, language education, and applied linguistics. They also possess extensive international experience, having taught English on continents around the globe. Our research, measurement, and statistics teams include some of the world's

most distinguished scientists and internationally recognized leaders in diverse areas such as test validity, language learning and assessment, and educational measurement.

To date, more than 300 peer-reviewed TOEFL research reports, technical reports, and monographs have been published by ETS, and many more studies on TOEFL tests have appeared in academic journals and book volumes. In addition, over 20 TOEFL related research projects are conducted by ETS's Research & Development staff each year and the TOEFL Committee of Examiners (COE), comprised of language learning and testing experts from the academic community, funds an annual program of TOEFL research by independent external researchers from all over the world.

The purpose of the *TOEFL Research Insight Series* is to provide a comprehensive yet user-friendly account of the essential concepts, procedures, and research results that assure the quality of scores for all members of the TOEFL Family of Assessments. Topics covered in these volumes include issues of core interest to test users, including how tests were designed, evidence for the reliability and validity of test scores, and research-based recommendations for best practices.

The close collaboration with TOEFL score users, English language learning and teaching experts, and university scholars in the design of all TOEFL tests has been a cornerstone to their success. Therefore, through this publication, we hope to foster an ever-stronger connection with our test users by sharing the rigorous measurement and research base and solid test development that continues to ensure the quality of the TOEFL Family of Assessments.

**Dr. John Norris**

Senior Research Director  
English Language Learning and Assessment  
Research & Development Division  
Educational Testing Service (ETS)

The following individuals contributed to the second edition (2018) by providing careful reviews and revisions as well as editorial suggestions (in alphabetical order): Terry Axe, Ian Blood, Jill Burstein, Ikkyu Choi, Keelan Evanini, Yoko Futagi, Michelle Hampton, Spiros Papageorgiou, Eileen Tyson, Lin Wang, and Klaus Zechner. The primary author of the first edition was Mary K. Enright. Cristiane Breining, Brent Bridgeman, Don Powers, Rosalie Szabo, Xiaofei Tang, Eileen Tyson, Miyoung Kim Wolf, and Xiaoming Xi also contributed to the first edition.

## TOEFL Research

The TOEFL program has long recognized and supported the importance of research in maintaining and improving test quality. Since the mid-1970s, a portion of the annual TOEFL budget has been committed to fund and disseminate research on issues related to language assessment. ETS supports a research program to advance knowledge in the field of language assessment and second-language acquisition. The goals are to:

- improve language assessments and related products,
- assure that they meet professional standards, and
- develop the foundation for new products and services.

The COE, a body of twelve individuals from around the world, each of whom has achieved professional recognition in an academic field related to English as a second or foreign language, works closely with ETS on its program of research.

## The Research Process

TOEFL research is carried out in consultation with the COE. It advises the TOEFL program about research needs and, through its Research Subcommittee, administers the COE research program. Through this program, the COE solicits, reviews, and approves the funding of research proposals from experts around the globe. The TOEFL program also funds an extensive program of research conducted at ETS by its own staff.

To encourage external experts to conduct TOEFL research, the COE publishes an annual announcement of its research program, describing high-priority research topics. Applications are invited from research professionals who have expertise in English language learning and assessment and who are affiliated with research institutions, such as universities or not-for-profit organizations. The COE Research Subcommittee reviews the preliminary funding applications. Invitations to submit a full proposal are issued to selected applicants based on the quality of the preliminary application. Full research proposals are then evaluated in terms of their relevance to the identified research topics, the feasibility and quality of the proposed research, the qualifications of the principal investigator, organizational capacity to conduct the research, and cost effectiveness.

The quality of TOEFL research is ensured through a rigorous review process. Three to four ETS and external experts review proposals and reports. The reviewers may include applied linguists, psychologists, statisticians, psychometricians, or assessment specialists. After reports are reviewed, researchers are encouraged to disseminate their findings in professional journals or as TOEFL reports.

The TOEFL program also provides a variety of other monetary grants and awards to recognize and support significant activities or projects related to the field of English language education, and to promote high-quality language assessment research.

Small grants are available to promising students working in the area of foreign- or second-language assessment that will help them finish their dissertations in a timely manner. Grants are also available to

enable practitioners to become involved in ETS's efforts in promoting English learning and to encourage the broad dissemination of information on English language testing, teaching, and teacher education through presentations at conferences outside the United States.

Information about TOEFL grants and awards is published at <https://www.ets.org/toefl/grants>.

## Description of Selected TOEFL Research

More than 200 TOEFL related research reports have been published by ETS (<https://www.ets.org/toefl/research>). Moreover, since the year 2000 alone, more than 100 academic journal articles and book chapters on TOEFL related research have been published, as well as two books and more than 100 presentations at academic conferences. Certain research topics such as test validation, fairness, and reliability have been repeatedly re-examined over time as test methods and content evolved. Other topics include innovations in testing (such as advances in psychometrics, automated scoring, and computer-based testing) and projects focused on the implications of theories of language proficiency for test design.

Reports published through 2014 are categorized in TOEFL Research: Ensuring Test Quality (ETS, 2014), which includes links to downloadable copies of the reports. More than fifty recent reports are organized by the following categories:

- Validity Evidence
- Fairness and Accessibility
- Support for Test Revision
- Scoring and Technology
- Candidates and Populations
- Reliability and Generalizability
- Score Interpretation

Searches for reports on a variety of educational and measurement topics can be carried out at <https://www.ets.org/toefl/research>.

A comprehensive summary of all the research sponsored by ETS is well beyond the scope of this document. Nevertheless, in the pages that follow, we will make a selective presentation concentrating on topics not reviewed in other publications. The extensive program of research to improve language assessment that resulted in the TOEFL iBT test is documented in a book edited by Chapelle, Enright, and Jamieson (2008). Summaries of research and procedures to ensure that the TOEFL test complies with professional standards for validity (ETS, 2018c) and reliability are available (ETS, 2018a). In this section, we will focus on recent research concerning test fairness and automated analysis of writing and speaking.

## Research on Test Fairness

Fairness in testing is an important measurement standard that the TOEFL program strives to meet. For the TOEFL test, test fairness means that the test scores can be interpreted as a measure of academic English language ability for various groups of test takers. Fairness requires that test scores should not be affected by factors that are not relevant to this intended interpretation. Although care is taken during test development to ensure that test content meets fairness guidelines, empirical research studies are also conducted to determine the impact of various factors on test scores. Four studies have addressed three fairness issues related to TOEFL iBT test scores: (a) the structure of the test for different groups of test takers, (b) the impact of educational and cultural background on reading performance, and (c) the performance of native English-speaking college students on the TOEFL iBT test.

One fairness issue concerns what specialists refer to as the factor structure of test scores for different groups of test takers. Factor analysis is a statistical research method that can be used to determine the underlying statistical structure of scores on a test. The factor structure of a test should be consistent with the theoretical structure implied by the test's construct—the characteristic that the test is designed to measure (e.g., English language proficiency). A test's factor structure also has implications for how scores should be reported and interpreted. Stricker and Rock (2008) analyzed the factor structure of a 2003–2004 TOEFL iBT field test form for three groups of test takers. Test takers were grouped according to (a) whether their first language was from an Indo European versus a non-Indo European language family, (b) how widely English was used in education and business contexts in their native countries, and (c) years of studying the English language in school. The same factor structure was found for all subgroups. Recent factor analyses of operational TOEFL iBT forms (Gu, 2014; Manna & Yoo, 2015; Sawaki & Sinharay, 2013) also showed that the test's factor structure was consistent across different groups defined by first language and test taker background characteristics. A consistent factor structure across different groups of test takers provides evidence that the test measures the same construct for the groups studied and that score aggregation and reporting procedures lead to appropriate score interpretations for these groups.

Another important question that researchers have asked about the fairness of the TOEFL iBT test is whether factors other than English language proficiency impact test performance. Liu, Schedl, Malloy, and Kong (2009) asked this question in regard to the TOEFL iBT Reading section, which has fewer but longer reading passages than previous versions of the TOEFL test. Their concern was that the decreased topic variety might increase the likelihood that test takers' familiarity with the particular topic of a given passage would influence their reading performance on the test. Accordingly, they investigated whether TOEFL iBT reading performance was affected by test takers' outside knowledge, gained either through academic major or from immersion in a particular culture. Performance on six passages and associated questions from five TOEFL iBT test administrations were examined. Three of the passages focused on topics in physical science, and the rest emphasized European or Japanese cultures. Techniques known as differential item functioning (DIF) and differential bundle functioning (DBF) were used to investigate the impact of outside knowledge on TOEFL iBT reading performance. DIF occurs for an item when differences in performance exist after examinees are matched on the abilities that the item is intended to measure. Liu et al. found little evidence that the sources of outside knowledge they investigated influenced overall performance on the reading passages. Further, the analysis of the items

displaying DIF suggests that the differences in performance may be construct-relevant differences that TOEFL iBT is intended to measure (e.g., vocabulary knowledge). To ensure continued fairness, the researchers made some recommendations to carefully scrutinize passages with technical vocabulary or culture-specific knowledge in the future.

Another study (Hill & Liu, 2012) explored the interaction between test takers' language proficiency and background knowledge, with the focus on their discipline-specific knowledge and cultural familiarity. The study reanalyzed the data used in Liu et al. (2009) employing DIF methods and concluded: "When examined holistically, the TOEFL iBT reading passages were neither advantageous nor disadvantageous to those who had physical science backgrounds or were familiar with a certain culture, and this holds for both the lower and higher proficiency groups" (Hill & Liu, 2012, p. 28).

A third fairness concern is that the TOEFL iBT test, with its academic content and tasks that require integrating different language skills, might be very difficult even for native English speakers. Native speakers, overall, do not represent the "ultimate criterion group for an ESL test, because they vary in formal and informal education in English and in linguistic ability" (Stricker, 2002, p. 1). Nevertheless, if educated native English speakers cannot do as well as educated non-native speakers on the TOEFL iBT test, it might be claimed that non-native speakers are being held unfairly to a higher standard in admissions decisions than native speakers. Cline and Powers (2009) compared the performance of first-year college students who were native speakers of English with that of non-native speakers. They administered one form of the 2003–2004 TOEFL iBT field test to more than 900 first-year, native English-speaking students at community colleges and nonselective 4-year colleges and compared their performance with that of the non-native speakers who had completed the field study form. Overall, the native English-speaking college students performed better than non-native speakers, although there was a reasonable amount of variation in scores within this group. The mean score differences favoring the native English speakers were moderate for listening, reading, and writing whereas they were large for speaking and for the total score. The implications are that the TOEFL iBT test is neither inappropriately difficult for non-native English speakers nor is it unusually easy for native English speakers. This suggests that non-native speakers are being held to a high standard, but not an unfair one.

In sum, these studies of test structure, test content, and native-speaker performance illustrate some of the fairness issues that have been addressed empirically through TOEFL research.

### **Automated Scoring for Writing and Speaking**

Two needs arise when a test includes extended constructed-response tasks, such as the Writing and Speaking tasks on the TOEFL iBT test. One of these is the need to score the responses efficiently and reliably. The other is to provide test takers with opportunities to practice and receive feedback on their performance prior to taking the test. ETS and the TOEFL program have been laying the foundation for new products and services that address these needs through research on automated scoring of writing and speaking. Capabilities developed at ETS that address these needs include the *e-rater*<sup>®</sup> engine and the *SpeechRater*<sup>SM</sup> engine.

## ***e-rater* Engine**

The *e-rater* engine uses natural language processing methods to automatically score test takers' essays as well as to provide feedback on the quality of their writing. The *e-rater* engine identifies errors in grammar, usage, and mechanics, as well as discourse structure and undesirable stylistic features in an essay. These features, along with measures of the vocabulary and sentence variety used in the essay, go into the *e-rater* engine's statistical model to predict human holistic ratings on essays. The engine is also used in practice-and-learning products such as *Criterion*® Online Writing Evaluation Service and *TOEFL*® Practice Online (*TPO*™ practice tests). The *Criterion* service is a web-based instructional tool that helps students plan, write, and revise essays, and it uses the *e-rater* engine to provide instant scoring and annotated diagnostic feedback.

An extensive program of research contributed to the continuous development and refinement of these capabilities and their evaluation for use in different contexts. Although this research initially focused on analyzing and scoring essays written primarily by native English speakers (e.g., Kaplan et al., 1998), attention soon expanded to include research on essays written specifically by non-native English speakers (e.g., Chodorow & Burstein, 2004).

One area of research interest is the validity of using the *e-rater* engine in conjunction with human raters to score the TOEFL iBT Writing tasks. In their summary of research on the use of the *e-rater* engine for the independent Writing task, Enright and Quinlan (2010) reported that the *e-rater* engine has been found to agree with human raters as well as or better than human raters agree with each other when rating these essays. Overall, the empirical evidence summarized by Enright and Quinlan supports the use of the *e-rater* engine as a complement to human raters to score TOEFL independent essays. Research has also been conducted to evaluate the use of the *e-rater* engine for the integrated Writing task, which requires test takers to summarize and synthesize academic reading and listening materials in writing. The areas of research included the degree of agreement of the *e-rater* engine with human scores, the relationships of human and *e-rater* engine scores to independent indicators of language ability, and the impact of the use of the *e-rater* engine on scores by demographic subgroup. The results yielded evidence in support of the use of the *e-rater* engine to complement human raters for the TOEFL integrated Writing task as well. These studies are summarized in Ramineni, Trapani, Williamson, Davey, and Bridgeman (2012).

ETS is also continually conducting research on the technology underlying the *e-rater* engine, to improve existing features as well as to expand construct coverage of the engine, much of which is directly relevant to the TOEFL test. Such research includes, for example, studies on preposition and comma error detection (Israel, Tetreault, & Chodorow, 2012; Tetreault, Foster, & Chodorow, 2010). Burstein, Flor, Tetreault, Madnani, and Holtzman (2012) systematically examined the paraphrase strategies used by native and non-native English speakers in a TOEFL integrated task as a first step toward informing the development of new *e-rater* engine features. Beigman Klebanov, Madnani, Burstein, and Somasundaran (2014) described a method of automatically detecting effective use of source (e.g., stimulus lecture) in a TOEFL integrated task.

Collaboration between the TOEFL program and ETS's Research & Development division has made a unique contribution to the field of natural language processing and corpus linguistics, too, by making it possible to release the ETS Corpus of *Non-Native Written English* (Blanchard, Tetreault, Higgins, Cahill, & Chodorow, 2013), which is publicly available through the Linguistic Data Consortium. The corpus consists of 12,100 English essays written for the TOEFL test by speakers of eleven non-English native languages (1,100 per language) during 2006–2007. Originally developed with the specific task of native language identification in mind, the corpus can support a wide range of applications of natural language processing to the educational domain, including grammatical error detection and correction, automatic essay scoring, and studies in corpus linguistics.

### **SpeechRater Engine**

Automated scoring of speech is a more recent development than automated scoring of writing and presents a greater challenge because of the difficulty of automatically recognizing the words in continuous speech. Although speech scoring systems for simple tasks that require the production of a limited or predictable range of vocabulary have been in use for a number of years (see Zechner, Higgins, Xi, & Williamson, 2009, for review), the tasks on the TOEFL Speaking section are more complex. The Speaking section includes six tasks that require test takers either to respond to a relatively general question or to respond to oral and/or written input. TOEFL iBT spoken responses are scored holistically by raters using a four-point scale; however, the raters are instructed to attend to three key aspects of performance: delivery, language use, and topic development (see ETS, 2018b). Given the complexity of the TOEFL Speaking tasks and scoring guidelines, a number of factors make the automated analysis of the TOEFL Speaking samples difficult. These are (a) the length of the responses (45 to 60 seconds); (b) variability in topics, discourse structure, and lexical choices; (c) great diversity in test takers' accents; (d) the wide range of proficiencies in speaking; and (e) the different aspects of a response to be considered in scoring.

The *SpeechRater* engine, developed at ETS, is used currently to automatically score responses to TOEFL iBT Speaking tasks in the practice environment of TOEFL Practice Online (Zechner et al., 2009). The engine consists of four components: a speech recognizer, a feature computation module, a filtering model, and a scoring model. The speech recognizer was trained on around 800 hours of responses by non-native English speakers to TOEFL iBT Speaking tasks. The feature computation module uses the output of the speech recognizer to compute a set of features related to various aspects of speaking proficiency (e.g., fluency, pronunciation, vocabulary). The filtering model flags responses that should not be scored by the *SpeechRater* engine (e.g., responses with no speech or with high levels of noise). The scoring model uses the features from the feature computation module to statistically predict a score for each response.

Research related to the *SpeechRater* engine has addressed many aspects of system quality, including the construct coverage of the scoring features and the prediction accuracy of the scoring model (Loukina, Zechner, Chen, & Heilman, 2015; Zechner, Higgins, & Xi, 2007; Zechner et al., 2009). The engine's speech recognizer provides information about word identity and timing. Speech scientists at ETS have developed more than 100 features that are extracted from the output of the speech recognizer and other signal processing

and natural language processing software. These features are consistent with the construct of communicative language ability as embodied in the TOEFL iBT scoring guidelines. They are mainly related to the delivery and language use areas of the TOEFL iBT scoring guidelines, measuring aspects of fluency, pronunciation, prosody, vocabulary, and grammar. There are also a few features related to the content and discourse aspects of TOEFL iBT Speaking responses. To build the *SpeechRater* engine's scoring model, only a subset of the available features is used. The goal here is to select features for a broad coverage of the construct, minimizing features that are highly correlated to other features in the model, and selecting features with high correlations to human rater scores (Loukina et al., 2015). For *SpeechRater* Version 6, which was deployed for TPO in 2017 using data from the TOEFL Practice Online Speaking section, the correlation between the *SpeechRater* scores and human scores was .78 while that between two human raters was .88.

Research on the *SpeechRater* engine is ongoing. Among the goals are (a) to improve the accuracy of the speech recognizer, (b) develop features to provide better coverage of the construct, and (c) to improve the agreement of the *SpeechRater* scores with those of human raters.

### Explore TOEFL Research

This brief description of a few studies does little to convey the extent of the contribution that ETS and the TOEFL program have made to advancing knowledge of language assessment. Descriptions of more than 200 research studies are available on the TOEFL website, illustrating the program's commitment to advancing the field and meeting high standards for educational measurement. To view these descriptions and download selected reports, visit the TOEFL research website (<https://www.ets.org/toefl/research>).
